#### Ex.No.6

#### **Data Wrangling**

#### Aim:

To do Data Wrangling functions

### **Description:**

Data wrangling is the task in data science and analysis which includes operations

like: Data Sorting: To rearrange values in ascending or descending order.

Data Filtration: To create a subset of available data.

Data Reduction: To eliminate or replace unwanted values.

Data Access: To read or write data files.

Data Processing: To perform aggregation, statistical, and similar operations on specific values.

- 1. Using join function to join two DataFrames.
- 2. Using combine function to combine two DataFrames.
- 3. Using merge function to merge two DataFrames.
- 4. Using replace function to replace the NaN values by average value.
- 5. Filtering and dropping the rows and rows and columns respectively.
- 6. Using concat function to concatenate two DataFrames.
- 7. Using melt function to reshape the DataFrame dimention.
- 8. Using groupby function to group the data set.
- 9. Using duplicated function to remove duplicated rows in the DataFram
- 10. Using merge function to merge two DataFrame data sets.

#### PROGRAM:

```

```

```
